I had a couple of problems getting this going. Mainly the issues I ran into were time, however, in regards to the assignment itself, I only really had issues with handling nested requests. The rest of the assignment, albeit frustrating at times, was relatively straightforward. Luckily thanks to stack overflow, I was able to remedy this pretty quickly. My background as a web developer came in handy in this instance for sure.

The other issue I had was when I was making calls to the Open Weather Map. At first the calls weren't going through, which funny enough eventually did go through and I am not sure why. I tried out the addition to the To-Do app, because productivity is something I have a lot of fun with and that project ended up being way more fun than I thought it would be. I see myself working on that a little bit more and expanding it further.
