cs290

     For the how-to guide, I decided my project would be to work with Less, the css framework. I landed on this for a couple of reasons. First of all, Less is an up and coming framework that has garnered a lot of attention for the ease of use and attributes that you can connect with your existing application. But, I also selected it because it's something I use on a normal basis, we currently use it at the company that I work at and while I am more back end, it's something that I would like to understand on a larger scale.

     I have done some research on it so far, here and there, so I can ensure I know what it's doing while I am writing other levels of code for our application. I think doing a write up of what makes it better than traditional css, plus the pros and cons for Less will be good. One of the other cool things bout Less is its built with Node, something I have a lot of experience with. I would also like to explore the differences in Less and Sass showing code examples of both and why you might want to use one over the other.

     Finally, I would go over the installation process and help the user built a project on their own to show others. This will give the user the sense that they have done something with their time and can thus feel accomplished.
